

PI Webcam Server

ALEJANDRO AGUILAR

BRIAN FAURE

Purpose/Concept

- ▶ Have a Webcam that would provide constant images of an area
- ▶ Cost efficient
- ▶ Easy Installation
- ▶ Usages
 - ▶ Security
 - ▶ Baby Monitor
 - ▶ Plant Monitor

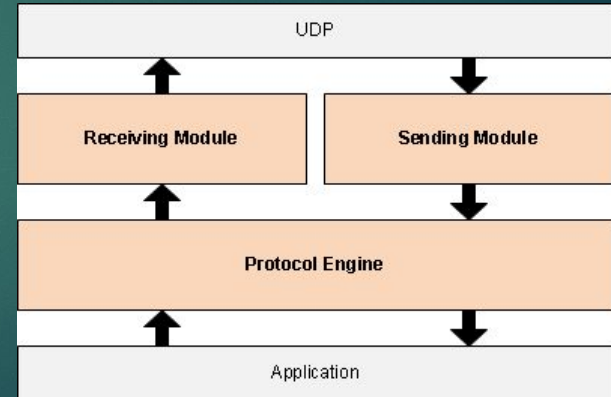

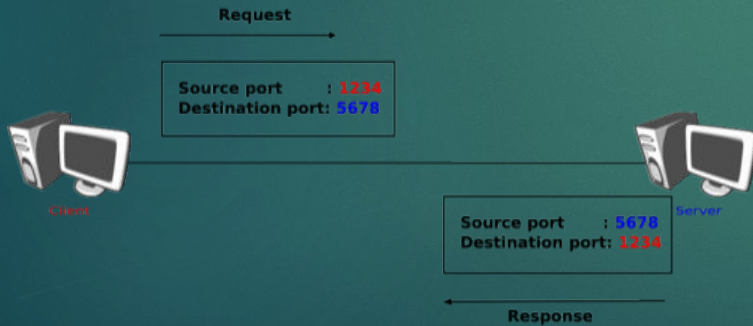

Functionality

- ▶ Camera will be taking constant images
 - ▶ Images will be uploaded to a server
 - ▶ From any computer a live view can be seen of area

Protocol

- ▶ Our design uses UDP Protocol
 - ▶ Simple file transfer to remote host
 - ▶ Unreliable but faster
 - ▶ Can deliver to more than one client

Protocol (cont.)

- ▶ Server runs on updated version of our TFTP implementation
 - ▶ Supports **RFC 2348** (variable blocksize) & **RFC 1782** (OACK packet)
 - ▶ Desktop app specifies blocksize (**8000-byte**) in RRQ
 - ▶ Server responds with OACK (option acknowledgement)
 - ▶ Port Number is always 15213, hidden from users
- ▶ Desktop app (client) uses **Tftpy** (Python library)

```
client = tftpy.TftpClient("ip address", "port number", options={'blksize': 8000})
client.download("frame.png", "frame.png", timeout=0.2)
```

RFC 2348 modified RRQ/WRQ packet

'8000'

Desktop User Interface

Stream control

Connect

Improvements

- ▶ Speed
- ▶ For larger sized images speed is an issue
- ▶ Make viewing on mobile possible
